① Confusion Matrix

	Actual value (y)	
	1	0
1	3	2
0	1	1

	Actual	
	1	0
1	TP	FP
0	FN	TN

DATASET		Actual value		
x_1	x_2	y	\hat{y}	
—	—	0	1	→ Wrong prediction
—	—	1	1	→ Correct prediction
—	—	0	0	→ correct "
—	—	1	1	→ " "
—	—	1	1	→ " "
—	—	0	1	→ Wrong Prediction
—	—	1	0	→ " "

$$\text{Model Acc} = \frac{TP + TN}{TP + FP + FN + TN}$$

$$= \frac{3 + 1}{3 + 2 + 1 + 1} = \frac{4}{7} = 57.1\%$$

TP = True Positive
 TN = True Negative
 FP = False Positive
 FN = False Negative.

DATASET → Imbalance dataset

1000 datapoints $\left\{ \begin{array}{l} 900 \rightarrow 1 \\ 100 \rightarrow 0 \end{array} \right\}$ Imbalanced dataset

	Actual	
	1	0
1	900	100
0	0	0

Dumb Model → 1

$$\text{Accuracy} = \underline{\underline{90\%}}$$

② Precision = $\frac{TP}{TP+FP}$ } Out of all the actual values how many are correctly predicted.

		1	0	Actual
1		TP	FP	
0		FN	TN	
	Predicted			

↳ FP is Important

④ Recall = $\frac{TP}{TP+FN}$ } Out of all the predicted value how many are correctly predicted with actual values

		1	0	Actual
1		TP	FP	
0		FN	TN	
	Predicted			

FN ↓↓

Usecase 1 : Spam Classification

Text ⇒ Model ⇒ Spam/Not Spam.

		1	0	Actual
1		TP	FP	
0		FN	TN	
	Predicted			

⇒ Precision

TP ⇐ $\begin{matrix} \text{Mail} \rightarrow \text{Spam} \\ \text{Model} \rightarrow \text{Spam} \end{matrix}$ } Accurate Scenario

TN ⇐ $\begin{matrix} \text{Mail} \rightarrow \text{Not a Spam} \\ \text{Model} \rightarrow \text{Not a Spam} \end{matrix}$ } Accurate Scenario

Important ⇒ FP ⇐ $\begin{matrix} \text{Mail} \rightarrow \text{Not a Spam} \\ \text{Model} \rightarrow \text{Spam} \end{matrix}$ } Wrong Prediction
{Blunder}

FN ⇒ $\begin{matrix} \text{Mail} \rightarrow \text{Spam} \\ \text{Model} \rightarrow \text{Not a Spam} \end{matrix}$ } Wrong Prediction

Usecase \Rightarrow FN is Important

To predict whether a person has diabetes or not

	Diabetes	No Diabetes	Actual
Diabetes	TP	FP	
No Diabetes	FN \downarrow	TN	

Recall

TP \Leftarrow $\left. \begin{array}{l} \text{Actual} \rightarrow \text{Diabetes} \\ \text{Model} \rightarrow \text{Diabetes} \end{array} \right\} \text{Correct}$

TN \Leftarrow $\left. \begin{array}{l} \text{Actual} \rightarrow \text{No Diabetes} \\ \text{Model} \rightarrow " " \end{array} \right\} \text{Correct}$

FP \Leftarrow $\left. \begin{array}{l} \text{Actual} \rightarrow \text{No Diabetes} \\ \text{Model} \rightarrow \text{Diabetes} \end{array} \right\} \text{Wrong Prediction}$

FN \Rightarrow $\left. \begin{array}{l} \text{Actual} \rightarrow \text{Diabetes} \\ \text{Model} \rightarrow \text{No Diabetes} \end{array} \right\} \text{Blunder}$

Assignment : Tomorrow the stock market will crash or not

Reduce FP \downarrow or FN \downarrow

$$\textcircled{5} \text{ F-Beta Score } = \left(1 + \beta^2 \right) \frac{\text{Precision} * \text{Recall}}{\text{Precision} + \text{Recall}}$$

① If FP and FN are both Important

$$\beta = 1$$

$$\text{F1 Score} = 2 * \frac{P * R}{P + R} \left. \vphantom{\frac{P * R}{P + R}} \right\} \Rightarrow \text{Harmonic Mean}$$

② If FP is more important than FN

$$\beta = 0.5$$

$$F_{0.5} \text{ Score} = (1 + 0.25) \frac{P * R}{P + R}$$

③ If FN is more important than FP

$$\beta = 2$$

$$F_2 \text{ Score} = (1 + 4) \frac{P * R}{P + R}$$
